(54) Title: METHOD AND ARRANGEMENT FOR THE GENERATION OF AN IDENTIFICATION DATA BLOCK

(57) Abstract: In a method of generating an identification data block, a unique identification data block is generated from part identification blocks, by means of an XOR function, for a data carrier (41) that contains at least one track, which track is defined by an item of start position (offset) information. Tracks on the data carrier (41) may contain files having file names in this case, individual part identification blocks being generated from associated items of start position information and from the file names, likewise by means of an XOR function.
